2021 Home and Community Preferences Survey:
A National Survey of Adults Age 18+

Methodology Report

November 2021

https://doi.org/10.26419/res.00479.004
This survey was conducted by NORC at the University of Chicago with funding from AARP. NORC at the University of Chicago and AARP collaborated on all aspects of the study design and reporting.

Data were collected using AmeriSpeak®, NORC’s probability-based panel designed to be representative of the US household population, including all 50 states and the District of Columbia. During the initial recruitment phase of the panel, randomly selected US households were sampled with a known, non-zero probability of selection from the NORC National Sample Frame and then contacted by US mail, email, telephone, and field interviewers (face-to-face). The panel provides sample coverage of approximately 97 percent of the US household population. Those excluded from the sample include people with P.O. Box only addresses, some addresses not listed in the USPS Delivery Sequence File, and some newly constructed dwellings.

Interviews for this survey were conducted between June 9, 2021, and July 6, 2021, with adults ages 18 and older representing the 50 states and the District of Columbia. Panel members were randomly drawn from AmeriSpeak, and 2,826 completed the survey that consisted of multicultural oversamples of Black, non-Hispanic (422 total), Asian American, non-Hispanic, (394 total) Hispanic (454 total), and LGBT (506 total) adults. NORC conducted 2,687 interviews online and 139 via telephone. Interviews were conducted in both English and Spanish, depending on respondent preference. Phone interviews were conducted by professional interviewers who were carefully trained on the specific survey for this study.

The final stage completion rate for the total sample of 2,826 is 29 percent, the weighted household panel response rate is 19.1 percent, and the weighted household panel retention rate is 75.0 percent, for a cumulative response rate of 4.2 percent. The margin of sampling error for the total sample of 2,826 is +/- 2.58 percentage points at the 95 percent confidence level, including the design effect.

Once the sample has been selected and fielded, and all the study data have been collected and made final, a post-stratification process is used to adjust for any survey nonresponse as well as any non-coverage or under- and oversampling resulting from the study-specific sample design. Post-stratification variables were age, gender, Census region, race/ethnicity, education and LGBT status. The benchmarks for weighting variables were obtained from the February 2021 Current Population Survey. The weighted data reflect the U.S. population of adults age 18 and over. Additionally, the data were weighted by AARP membership using statistics from the AARP membership database.

About NORC at the University of Chicago
NORC at the University of Chicago is an independent research institution that delivers reliable data and rigorous analysis to guide critical programmatic, business, and policy decisions. Since 1941, NORC has conducted groundbreaking studies, created and applied innovative methods and tools, and advanced principles of scientific integrity and collaboration. Today, government, corporate, and nonprofit clients around the world partner with NORC to transform increasingly complex information into useful knowledge.
NORC conducts research in five main areas: Economics, Markets, and the Workforce; Education, Training, and Learning; Global Development; Health and Well-Being; and Society, Media, and Public Affairs.
